

Term~I (initial mismatch) sets QSS error amplitude; Term~II (memory) is suppressed by $M_{MZ}^{-1} \leq 1\%$ across all ITER-ionising steps

(a) Term~I amplitude: initial fast-state mismatch (sets QSS error magnitude)

(b) Term~II suppression: $M_{MZ} \gg 1$ (Term~II $\leq M_{MZ}^{-1} \times$ Term~I)
